$$= -B_0 l y \frac{dy}{dt}$$

$$= B_0 l \,(y_0 + a \cos \omega t)\,(\omega a \sin \omega t)$$

For $0 < \omega t < \pi$, y is decreasing, flux enclosed by C is decreasing, and emf is positive opposing the change in the flux. For $\pi < \omega t < 2\pi$, y is increasing, flux enclosed by C is increasing, and emf is negative opposing the change in the flux. Thus, Lenz' law is verified. Also,

$$\text{emf} = B_0 l y_0 a \omega \sin \omega t + B_0 l a^2 \omega \cos \omega t \sin \omega t$$

$$= B_0 l y_0 a \omega \sin \omega t + \frac{1}{2} B_0 l a^2 \omega \sin 2\omega t$$

Thus the induced emf has two frequency components, ω and 2ω.

R2.3. $I(t) = \frac{d}{dt}\int_S \mathbf{D} \bullet d\mathbf{S}$

$$= \frac{d}{dt}\int_{r=0}^{a}\int_{\phi=0}^{2\pi} \varepsilon_0 E_0 \sin\frac{\pi r}{2a}\cos\omega t\,\mathbf{a}_z \bullet r\,dr\,d\phi\,\mathbf{a}_z$$

$$= -\omega\varepsilon_0 E_0 \sin\omega t \int_{r=0}^{a}\int_{\phi=0}^{2\pi} r\sin\frac{\pi r}{2a}\,dr\,d\phi$$

$$= -2\pi\omega\varepsilon_0 E_0 \sin\omega t\left[\frac{1}{(\pi/2a)^2}\sin\frac{\pi r}{2a} - \frac{1}{(\pi/2a)}r\cos\frac{\pi r}{2a}\right]_0^a$$

$$= -2\pi\omega\varepsilon_0 E_0 \sin\omega t\left[\frac{4a^2}{\pi^2}\right]$$

$$= -\frac{8\omega\varepsilon_0 E_0 a^2}{\pi}\sin\omega t$$

Amplitude of the current $= \frac{8\omega\varepsilon_0 E_0 a^2}{\pi}$

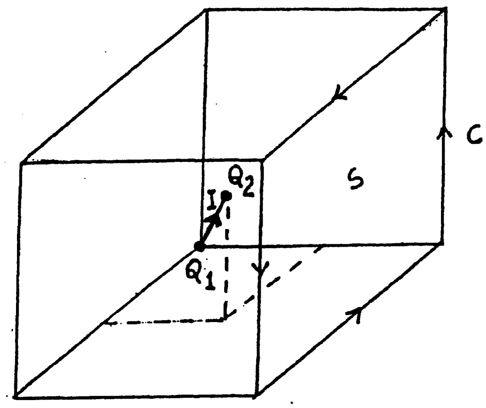
R2.4. $\oint_C \mathbf{H} \cdot d\mathbf{l} = \int_S \mathbf{J} \cdot d\mathbf{S} + \frac{d}{dt}\int_S \mathbf{D} \cdot d\mathbf{S}$

$$= 0 + \frac{d}{dt}\left(\frac{Q_1}{24} + \frac{Q_2}{6}\right)$$

$$= \frac{1}{24}\frac{dQ_1}{dt} + \frac{1}{6}\frac{dQ_2}{dt}$$

$$= \frac{1}{24}(-I) + \frac{1}{6}(I)$$

$$= \frac{1}{8}I$$



R2.5. From considerations of symmetry and application of

$$\oint_S \mathbf{D} \cdot d\mathbf{S} = \int_V \rho \, dv$$

to a spherical surface of radius r having the origin as its center, we have

$$4\pi r^2 D_r = \begin{cases} \int_{r=0}^{r} \int_{\theta=0}^{\pi} \int_{\phi=0}^{2\pi} \rho_0 \left(\frac{r}{a}\right)^2 r^2 \sin\theta \, dr \, d\theta \, d\phi & \text{for } r \le a \\ \int_{r=0}^{a} \int_{\theta=0}^{\pi} \int_{\phi=0}^{2\pi} \rho_0 \left(\frac{r}{a}\right)^2 r^2 \sin\theta \, dr \, d\theta \, d\phi & \text{for } r \ge a \end{cases}$$

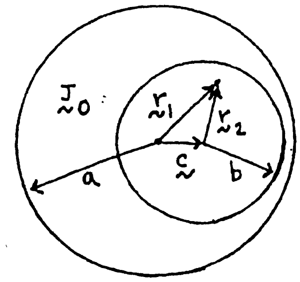
$$= \begin{cases} \frac{4\pi\rho_0}{a^2}\left[\frac{r^5}{5}\right]_0^r & \text{for } r \le a \\ \frac{4\pi\rho_0}{a^2}\left[\frac{r^5}{5}\right]_0^a & \text{for } r \ge a \end{cases}$$

$$= \begin{cases} \frac{4\pi\rho_0 r^5}{5a^2} & \text{for } r \le a \\ \frac{4\pi\rho_0 a^3}{5} & \text{for } r \ge a \end{cases}$$

$$D_r = \begin{cases} \frac{\rho_0 r^3}{5a^2} & \text{for } r \le a \\ \frac{\rho_0 a^3}{5r^2} & \text{for } r \ge a \end{cases}$$

$$\mathbf{D} = \begin{cases} \frac{\rho_0 r^3}{5a^2}\,\mathbf{a}_r & \text{for } r \le a \\ \frac{\rho_0 a^3}{5r^2}\,\mathbf{a}_r & \text{for } r \ge a \end{cases}$$

R2.6. We can consider the situation as the superposition of a current distribution $\mathbf{J}_0$ within the cylindrical region of radius a and a current distribution $-\mathbf{J}_0$ within the cylindrical region of radius b. Then expressing the result of **H** in Ex. 3.8 for the region $r < a$ in the manner



$$\mathbf{H} = \frac{J_0 r}{2}\mathbf{a}_\phi = \frac{J_0 \mathbf{a}_z \times r\mathbf{a}_r}{2} = \frac{1}{2}\,\mathbf{J}_0 \times \mathbf{r}$$

and applying it for the current-free region inside the cylindrical surface of radius b, we can write

$$\mathbf{H} = \frac{1}{2}\,\mathbf{J}_0 \times \mathbf{r}_1 + \frac{1}{2}\,(-\mathbf{J}_0) \times \mathbf{r}_2$$

$$= \frac{1}{2}\,\mathbf{J}_0 \times (\mathbf{r} - \mathbf{r}_2)$$

$$= \frac{1}{2}\,\mathbf{J}_0 \times \mathbf{c}$$
